## Computation of Mean

Basuki Nath Jha (B.Ed)

Godda College Godda
The mean is the most commonly used measure of central tendency. Computation of the mean requires scores that are numerical values measured on an interval or ratio scale. In education by Mean means simply arithmetic mean. To find the arithmetic mean, add the values of all terms and then divide sum by the number of terms, the quotient is the arithmetic mean. There are three methods to find the mean :

Direct method: In individual series of observations $\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots \mathrm{x}_{\mathrm{n}}$ the arithmetic mean is obtained by following formula.

$$
\text { A.M. }=\frac{x_{1}+x_{2}+x_{3}+x_{4} \ldots \ldots \ldots \ldots . . . x_{n-1}+x_{n}}{n}
$$

Short-cut method: This method is used to make the calculations simpler.

Let $A$ be any assumed mean (or any assumed number), $d$ the deviation of the arithmetic mean, then we have

$$
\boldsymbol{M}=A+\frac{\sum f d}{N} \quad(d=(x-A))
$$

Step deviation method: If in a frequency table the class intervals have equal width, say $i$ than it is convenient to use the following formula.

$$
\boldsymbol{M}=A+\frac{\sum f u}{N} \times i
$$

where $u=(x-A) / i$, and $i$ is length of the interval, A is the assumed mean.

Example 1. Compute the arithmetic mean of the following by direct and short -cut methods both:

Class
20-30 30-40 40-50 50-60 60-70
Frequency
$\begin{array}{llll}8 & 26 & 30 & 20\end{array}$ 16

Solution.

| Class | Mid Value <br> $\mathbf{x}$ | $\mathbf{f}$ | $\mathbf{f x}$ | $\mathbf{d = x}-\mathbf{A}$ <br> $\mathbf{A = 4 5}$ | $\mathbf{f d}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $20-30$ | 25 | 8 | 200 | -20 | -160 |
| $30-40$ | 35 | 26 | 910 | -10 | -260 |
| $40-50$ | 45 | 30 | 1350 | 0 | 0 |
| $50-60$ | 55 | 20 | 1100 | 10 | 200 |
| 6070 | 65 | 16 | 1040 | 20 | 320 |
| Total |  | $\mathrm{N}=100$ | $\sum \mathrm{fx}=4600$ |  | $\sum \mathrm{fd}=100$ |

## By direct method

$$
\begin{aligned}
\mathrm{M} & =\left(\sum \mathrm{fx}\right) / \mathrm{N} \\
& =4600 / 100 \\
& =46
\end{aligned}
$$

By short cut method.
Let assumed mean $\mathrm{A}=45$.

$$
\begin{aligned}
\mathrm{M} & =\mathrm{A}+\left(\sum \mathrm{fd}\right) / \mathrm{N} \\
& =45+100 / 100 \\
& =46
\end{aligned}
$$

Example 2: Compute the mean of the following frequency distribution using step deviation method. :

| Class | $0-11$ | $11-22$ | $22-33$ | $33-44$ | $44-55$ | $55-66$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Frequency | 9 | 17 | 28 | 26 | 15 | 8 |

Solution.

| Class | Mid-Value | $\mathbf{f}$ | $\mathbf{d = x}-\mathbf{A}$ <br> $(\mathbf{A}=\mathbf{3 8 . 5})$ | $\mathbf{u}=(\mathbf{x}-\mathbf{A}) / \mathbf{i}$ <br> $\mathbf{i}=\mathbf{1 1}$ | Fu |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $0-11$ | 5.5 | 9 | -33 | -3 | -27 |
| $11-22$ | 16.5 | 17 | -22 | -2 | -34 |
| $22-33$ | 27.5 | 28 | -11 | -1 | -28 |
| $33-44$ | 38.5 | 26 | 0 | 0 | 0 |
| $44-55$ | 49.5 | 15 | 11 | 1 | 15 |
| $55-66$ | 60.5 | 8 | 22 | 2 | 16 |
| Total |  | $\mathrm{N}=103$ |  |  | $\sum \mathrm{fu}=-58$ |

Let the assumed mean $\mathrm{A}=38.5$, then

$$
\begin{aligned}
\mathrm{M} & =\mathrm{A}+\mathrm{i}\left(\sum \mathrm{fu}\right) / \mathrm{N}=38.5+11(-58) / 103 \\
& =38.5-638 / 103 \\
& =38.5-6.194 \\
& =32.306
\end{aligned}
$$

The End
